Use the *FTS Template* dialog to create a new text search template. A text search template defines the functions that implement text search dictionaries.

The *FTS Template* dialog organizes the development of a text search Template through the following dialog tabs: *General*, and *Definition*. The *SQL* tab displays the SQL code generated by dialog selections.

The screenshot shows a dialog box titled "Create - FTS Template". It has three tabs: "General", "Definition", and "SQL". The "General" tab is active. It contains three fields: "Name" with the value "eng.template", "Schema" with a dropdown menu showing "public", and a large text area for "Comment". At the bottom, there are three buttons: "Cancel", "Reset", and "Save".

Use the fields in the *General* tab to identify a template:

- Use the *Name* field to add a descriptive name for the template. The name will be displayed in the *pgAdmin* tree control.
- Select the name of the schema in which the template will reside from the drop-down listbox in the *Schema* field.
- Store notes about the template in the *Comment* field.

Click the *Definition* tab to continue.

The screenshot shows a dialog box titled "Create - FTS Template" with a close button (X) in the top right corner. It has three tabs: "General", "Definition" (which is selected and underlined), and "SQL". In the "Definition" tab, there are two rows. The first row is labeled "Init function" and has a dropdown menu with the text "brin\_inclusion\_opcinfo" and a small "x" and downward arrow icon. The second row is labeled "Lexize function" and has a dropdown menu with the text "dispell\_lexize" and a small "x" and downward arrow icon. At the bottom of the dialog, there are three buttons: an information icon (i), a question mark icon (?), and a "Cancel" button with an "x" icon. To the right of the "Cancel" button is a "Reset" button with a circular arrow icon, and to the right of that is a "Save" button with a floppy disk icon.

Use the fields in the *Definition* tab to define function parameters:

- Use the drop-down listbox next to *Init function* to select the name of the init function for the template. The init function is optional.
- Use the drop-down listbox next to *Lexize function* to select the name of the lexize function for the template. The lexize function is required.

Click the *SQL* tab to continue.

Your entries in the *FTS Template* dialog generate a SQL command (see an example below). Use the *SQL* tab for review; revisit or switch tabs to make any changes to the SQL command.

#### Example ¶

The following is an example of the sql command generated by user selections in the *FTS Template* dialog:

Create - FTS Template

General Definition SQL

```
1 CREATE TEXT SEARCH TEMPLATE public."eng.template" (  
2     INIT = brin_inclusion_opcinfo,    LEXIZE = dispell_lexize  
3 );
```

i ? x Cancel ↺ Reset Save

The example shown demonstrates creating a fts template named *ru\_template* that uses the ispell dictionary.

- Click the *Info* button (i) to access online help.
- Click the *Save* button to save work.
- Click the *Cancel* button to exit without saving work.
- Click the *Reset* button to restore configuration parameters.
